Tracing the conditions of conditions

Exact closure in the supplied ten-coordinate mechanism network

STARTING QUESTION

3

retained coordinates

Burden
Veto
Eligibility

FIRST EXPANSION

7

retained coordinates

Add circumstance, response, maintenance and capacity

CLOSED BASELINE

9

retained coordinates

Add record and authority

Badge can be omitted

NEW AUTHORITY RULE

10

retained coordinates

Authority now reads badge

Badge must be included in this coordinate closure

Omitting a genuine condition fails

Same starting burden, veto and eligibility; different maintenance.

Next burden probability: 0 vs 1/4

A new rule changes what must be represented

Different badge values reach the original protected burden.

Three-step burden probability: 3/8 vs 13/16

Constructed example • exact joint-noise calculations • sufficient coordinate closure, not semantic minimality

A faithful model can still describe harmful dynamics. Representation closure does not prove desirable persistence.
